

Fish Emulsion

**A product for both the nutrition of plants
as well as soil microbes**

Supa-Natural

Supa-Natural is a highly effective liquid fertilizer manufactured from pelagic fish. Pelagic fish are rich in macro and micro elements which they obtain from the mineral rich plankton on which they feed. The leaching effect of Supa-Natural is substantially lower than conventional chemical fertilizers because it is made up of finely emulsified fish flesh which is an excellent source of Carbon.

-  98% of the plant nutrients in Supa-Natural are immediately available to the plants. The higher tempo of absorption of these nutrients leads to optimal physiological growth.
-  Supa-Natural is an organic plant nutrient with pure forms of N; P; K; Ca; Mg; Zn; Fe; Mn; B; Cu; Mo and S.
-  Supa-Natural contains no carrier chemicals and will therefore not burn plants when used at recommended dosages.
-  Supa-Natural can be used both as a foliar feed and soil fertilizer and can be safely applied through tractor sprayer and through the irrigation.
-  Supa-Natural is an excellent source of Carbon (C) which is essential in good soil health. Carbon is both a habitat and food source for microbes which release other elements bound by the carbon into plant available elements.
-  Supa-Natural is rich source of amino acids which chelate minerals and increase and accelerate plant absorption.
-  Fish emulsion is regarded as the ultimate food source for beneficial soil micro-organisms. This product meets the protein requirements of these micro-organisms whereas humus only meets the carbohydrate needs of soil micro-organisms. Both humus and protein are imperative to healthy growth of soil microbes and addressing both the carbohydrate and protein requirements of the micro-organisms results in rapid and stronger growth of the microbes allowing for the better control soil pathogens. Supa-Natural can as a result be successfully used in compost manufacturing.
